Dear User,

Thank you for using our product. The TK-7 solar water heater requires computer control of its design for solar water heaters. This is achieved through the solar water heater's microcomputer, which controls the water heater's temperature and pressure. The solar water heater's temperature and pressure are controlled by the control unit, which provides accurate control of the water heater's temperature and pressure.

1. Connect the power source to the control unit. Ensure that the power source is correctly connected to the control unit.
2. Set the water temperature to the desired level. Ensure that the water temperature is set correctly.
3. Check the water pressure. Ensure that the water pressure is set correctly.
4. Set the water temperature to the desired level. Ensure that the water temperature is set correctly.
5. Check the water pressure. Ensure that the water pressure is set correctly.

Thank you for using our product. We hope that this guide will help you to use the TK-7 solar water heater correctly.
